

Roadmap to Learn ReactJS in 2023

The Ultimate Roadmap:

← SWIPE

A winding road with dashed white lines on a dark blue surface, set against a light blue background. Three location pins are placed along the road: a red pin with 'HTML5' on the left, a yellow pin with 'JS' at the top, and a blue pin with the ReactJS logo on the right.

I know that learning ReactJS can be intimidating for beginners, so I've created a **roadmap** to help you stay on track.

Here's the roadmap that you need to follow in 2023 🙌

1. Start with the basics

Before diving into React, make sure you have a solid understanding of **HTML, CSS, & JavaScript.**

This will help you hit the ground running when you start learning React.

2. Version Control

You can use **Git Version Control**. It is a version control tool that helps you manage your source code better.

It doesn't have a direct relationship with ReactJS.

However, when you work in production, you're going to thank yourself for learning Git.

3. Learn React basics

Spend enough time to truly grasp these concepts, as they are key concepts to master React.

4. Beginner to Intermediate

These concepts make you confident enough to take on most ReactJs challenges.

5. Intermediate to Advanced

These are few expert-level topics and some of them are optional too.
